

Colab, or "Colaboratory", allows you to write and execute Python in your browser, with

- Zero configuration required
- Access to GPUs free of charge
- Easy sharing

Whether you're a **student**, a **data scientist** or an **AI researcher**, Colab can make your work easier. Watch [Introduction to Colab](#) or [Colab Features You May Have Missed](#) to learn more, or just get started below!

Getting started

The document you are reading is not a static web page, but an interactive environment called a **Colab notebook** that lets you write and execute code.

For example, here is a **code cell** with a short Python script that computes a value, stores it in a variable, and prints the result:

```
seconds_in_a_day = 24 * 60 * 60
seconds_in_a_day
```

```
86400
```

To execute the code in the above cell, select it with a click and then either press the play button to the left of the code, or use the keyboard shortcut "Command/Ctrl+Enter". To edit the code, just click the cell and start editing.

Variables that you define in one cell can later be used in other cells:

```
seconds_in_a_week = 7 * seconds_in_a_day
seconds_in_a_week
```

```
604800
```

Colab notebooks allow you to combine **executable code** and **rich text** in a single document, along with **images**, **HTML**, **LaTeX** and more. When you create your own Colab notebooks, they are stored in your Google Drive account. You can easily share your Colab notebooks with co-workers or friends, allowing them to comment on your notebooks or even edit them. To learn more, see [Overview of Colab](#). To create a new Colab notebook you can use the File menu above, or use the following link: [create a new Colab notebook](#).

Colab notebooks are Jupyter notebooks that are hosted by Colab. To learn more about the Jupyter project, see [jupyter.org](#).

Data science

With Colab you can harness the full power of popular Python libraries to analyze and visualize data. The code cell below uses **numpy** to generate some random data, and uses **matplotlib** to visualize it. To edit the code, just click the cell and start editing.

You can import your own data into Colab notebooks from your Google Drive account, including from spreadsheets, as well as from Github and many other sources. To learn more about importing data, and how Colab can be used for data science, see the links below under [Working with Data](#).

```
import numpy as np
import matplotlib.pyplot as plt
from skimage.transform import resize

# 1. Generate a synthetic medical slice (e.g., a simulated brain MRI)
# We will create a high-resolution 512x512 image with a tiny bone crack and subtle tumor tissue.
size = 512
y, x = np.ogrid[-size/2:size/2, -size/2:size/2]

# Base anatomy (Skull)
skull = (x**2 + y**2 < 200**2) & (x**2 + y**2 > 185**2)
# Brain tissue
brain = (x**2 + y**2 <= 185**2).astype(float) * 0.4
# A subtle tumor (very close in intensity to brain tissue)
tumor = (((x-40)**2 + (y-40)**2) < 45**2).astype(float) * 0.08
# A tiny micro-fracture in the skull (spatial feature)
fracture = (((x+190)**2 + (y)**2 < 8**2) & (y > -15) & (y < 15))

# Combine to create the original high-quality image
original_img = brain + tumor + (skull.astype(float) * 0.9)
original_img[fracture] = 0.0 # dark crack in the skull
original_img = np.clip(original_img, 0, 1)

# --- 2. Simulating Low Pixel (Spatial) Resolution ---
# Downsample to 32x32 then upscale back to 512x512 to preserve display size
```

```

low_px_temp = resize(original_img, (32, 32), order=1, preserve_range=True)
low_pixel_res = resize(low_px_temp, (512, 512), order=0, preserve_range=True)

# --- 3. Simulating Low Intensity Resolution (2-bit depth / 4 gray levels) ---
# Quantize the intensities from float to 4 discrete levels (0, 1, 2, 3)
num_levels = 4
low_intensity_res = np.round(original_img * (num_levels - 1)) / (num_levels - 1)

# --- 4. Plotting and Comparison ---
fig, axes = plt.subplots(1, 3, figsize=(18, 6))

# Plot Original Image
axes[0].imshow(original_img, cmap='gray')
axes[0].set_title("Original High Res (512x512, Float64)\nCan see BOTH tiny fracture & subtle tumor", fontsize=11)
axes[0].axis('off')

# Plot Low Pixel Resolution
axes[1].imshow(low_pixel_res, cmap='gray')
axes[1].set_title("Low Pixel Res (32x32)\nTiny fracture disappears (blurred out)", fontsize=11)
axes[1].axis('off')

# Plot Low Intensity Resolution
axes[2].imshow(low_intensity_res, cmap='gray')
axes[2].set_title("Low Intensity Res (2-bit / 4 Levels)\nSubtle tumor merges into background tissue", fontsize=11)
axes[2].axis('off')

plt.tight_layout()
plt.show()

```

Colab notebooks execute code on Google's cloud servers, meaning you can leverage the power of Google hardware, including [GPUs](#) and [TPUs](#), regardless of the power of your machine. All you need is a browser.

For example, if you find yourself waiting for **pandas** code to finish running and want to go faster, you can switch to a GPU Runtime and use libraries like [RAPIDS cuDF](#) that provide zero-code-change acceleration.

To learn more about accelerating pandas on Colab, see the [10 minute guide](#) or [US stock market data analysis demo](#).

Machine learning

With Colab you can import an image dataset, train an image classifier on it, and evaluate the model, all in just [a few lines of code](#).

Colab is used extensively in the machine learning community with applications including:

- Getting started with TensorFlow
- Developing and training neural networks
- Experimenting with TPUs
- Disseminating AI research
- Creating tutorials

To see sample Colab notebooks that demonstrate machine learning applications, see the [machine learning examples](#) below.
